

# Lube Keeps Head on Target

**T**he targeting head on your M981 FISTV won't be locating many targets if it does not get lube when and where it's needed. The hydraulic cylinder locks, elevation cylinder bearings and pivot shaft bearings are perfect examples.

Without proper lube, the hydraulic cylinder locks suffer metal-on-metal wear. When the detents wear out, the targeting head can't be locked in place.

Lube the hydraulic cylinder locks with WTR every 25 turret hours, 250 miles or monthly, whichever comes first.

The elevation cylinder bearings and pivot shaft bearings control elevation of the head. No lube means no elevation. Plus, rust can cause the mounting bolts to elongate and snap.

Lube the elevation cylinder bearings and pivot shaft bearings with GIA every 25 turret hours, 250 miles or monthly, whichever comes first.
